Context

What is IoT ?

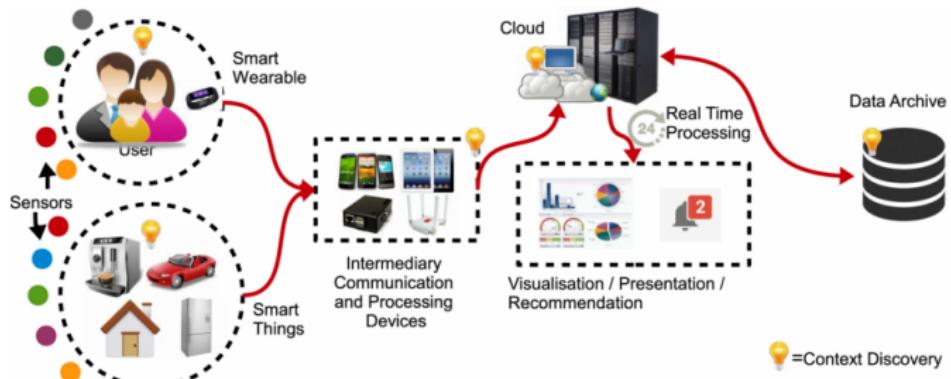

Figure 1: IoT platform.

Figure 2: IoT challenges.

Context

Introduction

- ➡ IoT Applications
 - ➡ Health care
 - ➡ **Transportation**
 - ➡ Industry
 - ➡ Market
 - ➡ School
 - ➡ Vehicles
 - ➡ Smart Home
 - ➡ Agriculture

Figure ??: IoT Applications

Problematic

Where is the problem ?

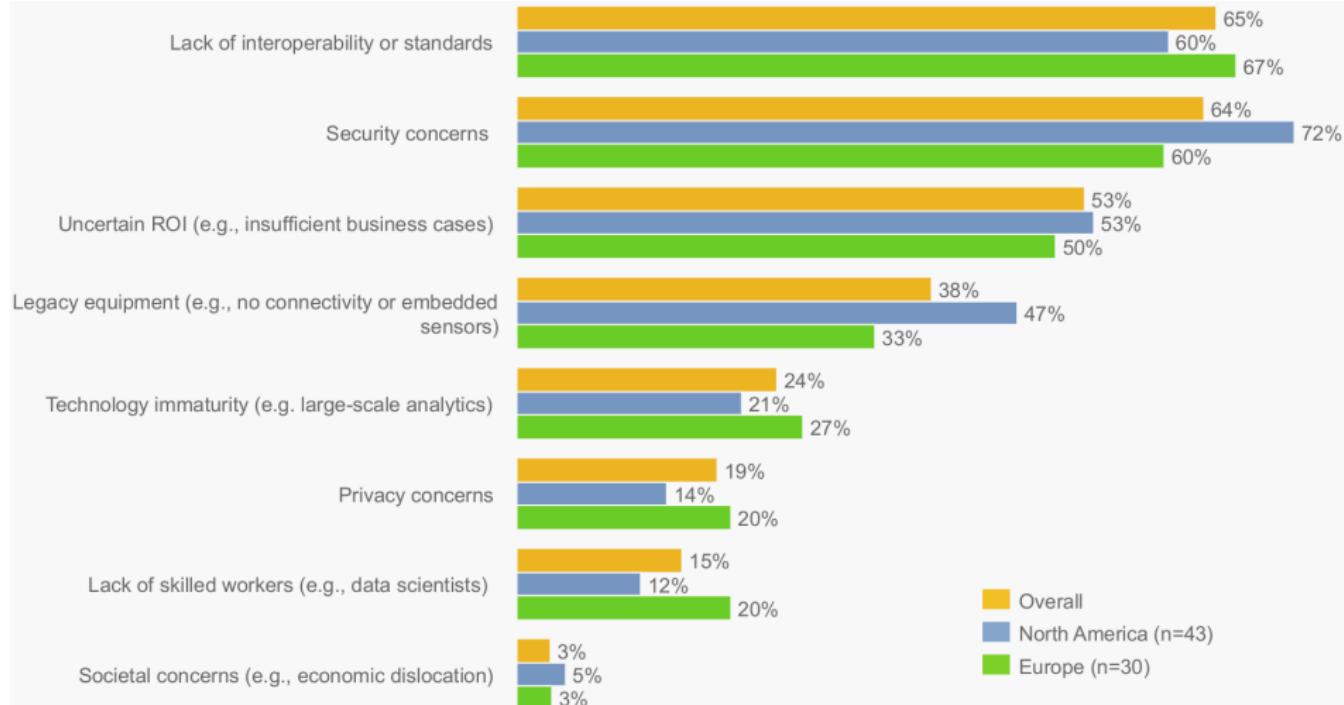

Figure 3: Key barriers in adopting the Industrial Internet [industrialinternetofthings_executive_].

Problematic

Where is the problem ?

- ➡ Some network configuration are static and not adaptive to the application
 - ➡ Decision and optimisation problem..
 - ➡ Various network access
 - ➡ Various configuration of each network access
 - ➡ Lack of selection tools
- ➡ Users have to select the network and the application
 - ➡ How to select the **best** network.
 - ➡ How to select the network required by the application.

Motivations

Who & why cares with such problems ?

- ➡ a
 - ➡ Lake of selective tools
 - ➡ How to select the **best** access point

QoS Analysis

- ➡ a
 - ➡ Lake of selective tools
 - ➡ How to select the **best** access point

Threats

- ➡ a
 - ➡ Lake of selective tools
 - ➡ How to select the **best** access point

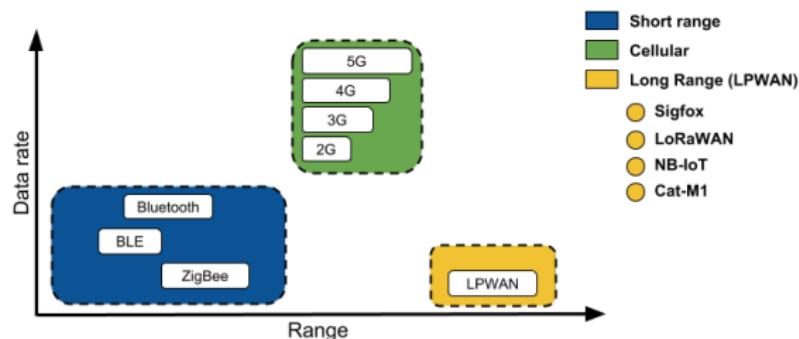

Figure 4: Communication diversity.

Goal

What is the goal ?

- ➡ ➡ Allow heterogeneous network to communicate
- ➡ QoS Analysis
- ➡ Threats

- ➡ How to select the **best** access point
 - ➡ Allow heterogeneous network to communicate
 - ➡ QoS Analysis
 - ➡ Threats

Figure 5: wsn-IoT.

Goal

What is the goal ?

- ➡ ➡ Allow heterogeneous network to communicate
- ➡ QoS Analysis
- ➡ Threats

- ➡ How to select the **best** access point
 - ➡ Allow heterogeneous network to communicate
 - ➡ QoS Analysis
 - ➡ Threats

Figure 5: wsn-IoT.

How to adapt the network to applications ?

Challenges

Where is the difficulty ?

- ▶ Reasonable and acceptable delay before the decision appears.
- ▶ Cope with the different view points and goals of the operators and the users.
- ▶ React to the changing environment conditions.
- ▶ Allow any type of inputs and to be applicable to any type of ANs.
- ▶ Handle the increasing number of RATs and the large number of criteria.

Contributions

Contributions

- ➡ Use cases (Requirements)
 - Smart building: Videos, Voice, Text.
 - Smart traffic: Videos, Voice, Text
- ➡ Environments
 - Rural/Urban
 - Static/Mobile
 - Temperature
- ➡ Scenarios
 - For each application protocol (MQTT, COAP, XMPP)
 - For each network protocol (Star, Mesh)
 - For each MAC protocol (LoRaWan, Sigfox, ...)
- ➡ Algorithms
 - Input:
 - * Service QoS requirements
 - * MAC configuration (SF, CR, BW, ...)
 - * Network QoS metrics
 - Method:
 - * MADM, Game, Neural
 - Outputs:
 - * Ranked networks

Genetic Algorithm

Related work [alkhawlani_access_2008a]

- ▶ Heterogeneous wireless network: (RAT 1 ,RAT 2 ,...,RAT n)
- ▶ Criteria up to i (c_1, c_2, \dots, c_i) the operators, the applications, and the network conditions.
- ▶
- ▶ The different sets of scores (d_1, d_2, \dots, d_i) are sent to the MCDM in the second component.
- ▶ GA component assigns a suitable weight (w_1, w_2, \dots, w_i)

Genetic Algorithm

Related work

→ S = SF12, BW125, 4/8, 17 dBm

→ Input:

→ Problem: $f(x) = \max(x^2)$, $x \in [0, 32]$

* $x_1 : 01101_b$

* $x_2 : 11000_b$

* $x_3 : 01000_b$

* $x_4 : 10011_b$

→ Method: Genetic algorithm

→ Generate a set of random possible solution

→ Test each solution and see how good it is (ranking)

* Remove some bad solutions

* Duplicate some good solutions

* Make small changes to some of them (Crossover, Mutation)

→ Output:

→ $x_1 : 01101$ (169) (14.4)

Related work

Learning Iterative Steps:

- **Choose** action $a_k(t) \sim \pi_k(t)$.
- **Observe** game outcome, e.g.,
 $a_{-k}(t)$
 $u_k(a_k(t), a_{-k}(t))$.
- **Improve** $\pi_k(t + 1)$.

Thus, we can expect that: $\forall k \in \mathcal{K}$,

$$\pi_k(t) \xrightarrow{t \rightarrow \infty} \pi_k^* \quad (1)$$

$$\bar{u}_k(\pi_k(t), \pi_{-k}(t)) \xrightarrow{t \rightarrow \infty} \bar{u}_k(\pi_k^*, \pi_{-k}^*) \quad (2)$$

where, $\pi^* = (\pi_1^*, \dots, \pi_K^*)$ is a NE strategy profile.

Technical choice

Implementation

- ➡ ZOLERTIA RE-MOTE
 - ➡ Low consumption component
 - ➡ ADC port for placing sensors on it
- ➡ CONTIKI OS
 - ➡ Operating system for wireless and low power development
 - ➡ Support for newer standards (6LowPAN, RPL, CoAP, MQTT)
- ➡ 6LowPAN
 - ➡ Based on IPv6 and IEEE 802.15.4
 - ➡ IPv6-based network with low power consumption
 - ➡ Ability to create a mesh network
- ➡ Sending packages
 - ➡ UDP in the 6LowPAN network
 - ➡ MQTT between the cloud platform and the router

9. Conclusion
- 10. Social privacy score**
11. Privacy Framework
12. Survey Privacy

Step 1: Individual vulnerability measurement

Method

Parameter	Value
Network connection	Private, Public
Technology	Ethernet, 5G, 4G, Wifi
Operating system	Windows, Unix, Mac
Web browser	Firefox, Chrome, Opera, ...
Password strength	low, medium, strength
Sessions opened	counter
TLS version	v1.0, v1.1, v1.2, v1.3

Table 24: Individual Vulnerability parameter

$$Y = \sum_i^n \frac{w * V}{n} \quad (6)$$

- **Y:** Individual vulnerability
- **w:** Weight of each vulnerability
- **V:** Scores mentioned above

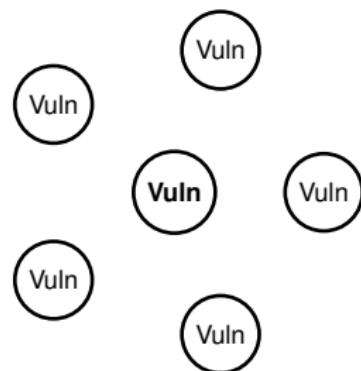

Figure 33: Individual vulnerability level.

Step 2: Users reputation estimation

Method

Parameter	Value
Frequency of msg exchanged	continuous
Discussion time	continuous
% of messages exchanged	cipher, signed or clear
Message type exchanged	Text, images, videos, script

Table 25: Trust grant features

$$\alpha = P(\text{reputation}) = P(X \geq 1) = 1 - (1 - P(\text{trust}))^n \quad (7)$$

Where,

- **X**: trust grant, random variable, $X \sim B(n,p)$
- **n**: deg(node)
- **P(X=1)**: The probability of being assigned one trust grant by an interlocutor

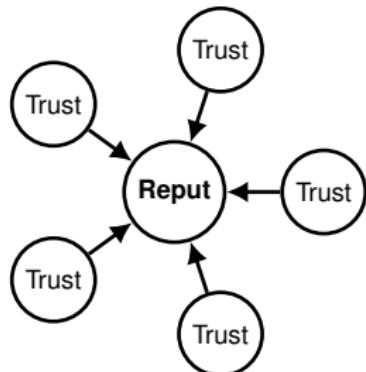

Figure 34: Reputation level.

Step 3: Social vulnerability measurement

Freidkin's theory of social influence

Input (Features):

- $Y^{(1)}$ = Vector of the individual vulnerabilities of N users (eq 9)
- α = The level of reputation (influence) of each user (eq 10)
- M = Adjacency matrix N x N

Model:

$$Y^{(t)} = \alpha M Y^{(t-1)} + (1 - \alpha) Y^{(t-1)} \quad (8)$$

Output:

- $Y^{(t)}$ = Vector of the social vulnerabilities of the N users

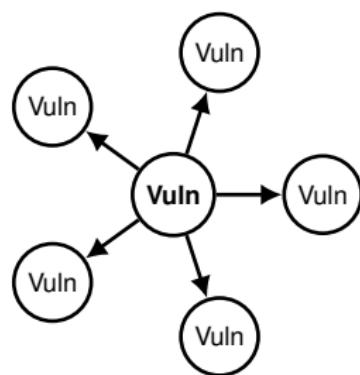

Figure 35: Social vulnerability.

Step 3: Social vulnerability measurement

Freidkin's theory of social influence

Formal properties of the model:

- When a user's influence is high, the model is reduced to:
 - average vulnerabilities of his friends weighted by their trust levels.

$$Y^{(t)} = 1 * MY^{(t-1)} + (1 - 1) Y^{(t-1)} \quad (11)$$

$$Y^{(t)} = MY^{(t-1)}$$

- In the absence of influence, the model is reduced to:
 - his own vulnerability weighted by the level of mistrust of his friends

$$Y^{(t)} = 0 * MY^{(t-1)} + (1 - 0) Y^{(t-1)} \quad (11)$$

$$Y^{(t)} = Y^{(t-1)}$$

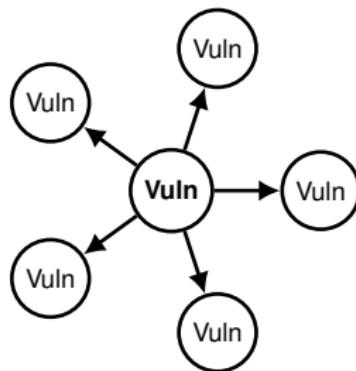

Figure 36: Social vulnerability.

Results

Comparison

Initial values:

- generated randomly (normal distribution)
- represent individual vulnerabilities.
- dark color = highly infected

Final values:

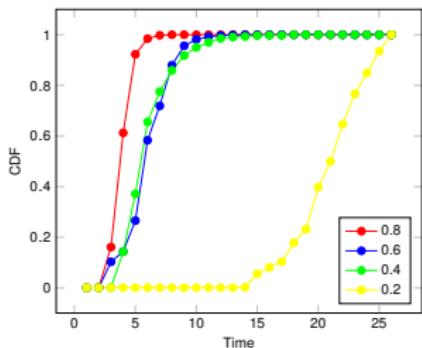

- obtained after convergence.
- represent social vulnerabilities.

Figure 39: Individual & Social privacy vulnerabilities.

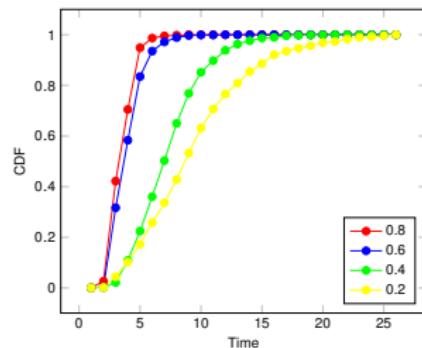

User ID	Individual Vul	Social Vul
34	0.84	0.67
67	0.12	0.87
206	0.76	0.33
588	0.23	0.78

Table 28: Individual and social privacy vulnerabilities.

Results exploitation

(a) Enron dataset.

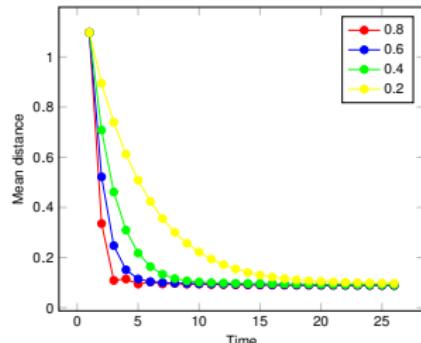

(b) Caliopen dataset.

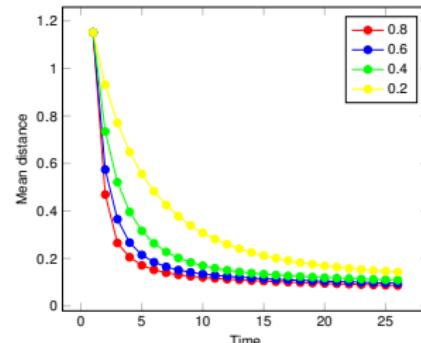

Figure 40: Cumulative distribution function of infected users.

- Figures shows the CDF of the vulnerability diffusion process.
- The vulnerability diffusion process increases as the reputation level of vulnerable users increases.
- Users with high reputation values contribute significantly to the diffusion
 - They spread their vulnerabilities quickly and widely through the network.

Results exploitation

(a) Enron dataset.

(b) Caliopen dataset.

Figure 41: Convergence of the diffusion process.

- ▶ The process converge when the mean distance between social vulnerability scores is the minimum.
- ▶ Assigning trust to vulnerable users allows them to achieve a high level of reputation.
- ▶ Consequently, they infect all other vulnerability values.

Discussion

- ➡ The purpose of this work is to simulate a diffusion process of individual vulnerabilities.
 - ➡ The vulnerability of one user is the vulnerability of all users.
 - ➡ At the end of the diffusion (convergence), all users gets their social vulnerability scores.
- ➡ Future work
 - ➡ To propose mechanisms to improve the reputation of non-vulnerable users.
 - * Suggest well known interlocutors with acceptable vulnerability scores.
 - ➡ To propose mechanisms to improve the vulnerability of reputed users.
 - * recommend configurations and softwares.

Discussion

 - 2. Processus de diffusion**
 3. Expérimentation
 4. Exploitation des résultats

Etape 1: Calcule de la vulnérabilité individuelle

Méthode

➡ Entrée:

➡ Vulnérabilité de la machine utilisée:

- * Connexion réseaux (privé (1) ou publique (2))
- * Type d'architecture: Ethernet, 5G, 4G, Wifi (1:4)
- * Système d'exploitation (Windows, Unix) (1:2)
- * Navigateur web (1:10)

➡ Vulnérabilité du compte utilisé

- * Mdp utilisé, mode de récupération des mdp (1:5)
- * Nombre de sessions ouvertes en même temps.(1:nbr)
- * Mode de chiffrement, signature, version TLS

➡ Sortie:

$$Pi = \sum_i^n \frac{w * V}{n} \quad (9)$$

Etape 2: Calcule de la réputation des utilisateurs

Méthode

► Entrée:

- Fréquence d'utilisation de la messagerie.
- Horaire, durée des échanges (1:5)
- % des échanges chiffrés, signés, claires (1:3)
- Importance des interlocuteurs: Liste favoris (2), noir(1)
- Type de données: Texte, images, vidéos, script (1:4)

► Méthode:

- Loi binomiale

► Output:

$$P(\text{reputation}) = P(X \geq 1) = 1 - (1 - P(\text{trust}))^n \quad (10)$$

- Where,

* X: Niveau de confiance, $X \sim B(n,p)$

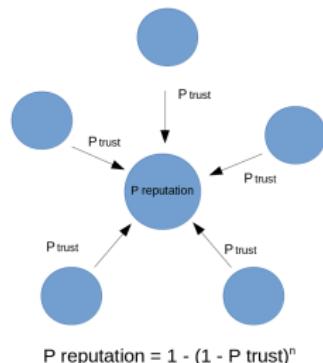

Figure 42: Niveau de réputation.

Etape 3: Calcule de la vulnérabilité sociale

Théorie de l'influence sociale de Freidkin

➡ Entrée:

- ⇒ $Y^{(1)}$ = Vecteur des vulnérabilités individuelles de N utilisateurs (eq 9)
- ⇒ α = Le niveau de réputation (d'influence) de chaque utilisateur (eq 10)
- ⇒ M = Matrice d'adjacence $N \times N$

➡ Modèle:

$$Y^{(t)} = \alpha M Y^{(t-1)} + (1 - \alpha) Y^{(t-1)} \quad (11)$$

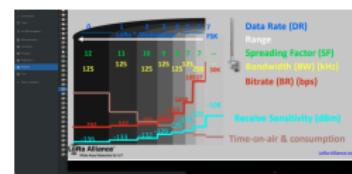

Figure 43: Vulnérabilité Sociale.

➡ Sortie:

- ⇒ $Y^{(t)}$ = Vecteur des vulnérabilités sociales des N utilisateurs

Etape 3: Calcule de la vulnérabilité sociale

Théorie de l'influence sociale de Freidkin

Propriétés formelles du modèle:

- Lorsque l'influence d'un utilisateur est élevé, le modèle se réduit aux:
 - vulnérabilités moyennes de ses amis pondérées par leur niveaux de confiances.

$$Y^{(t)} = 1 * MY^{(t-1)} + (1 - 1) Y^{(t-1)} \quad (11)$$
$$Y^{(t)} = MY^{(t-1)}$$

- En absence d'influence, le modèle se réduit à:
 - sa propre vulnérabilité pondérée par le niveau de méfiance de ses amis

$$Y^{(t)} = 0 * MY^{(t-1)} + (1 - 0) Y^{(t-1)} \quad (11)$$
$$Y^{(t)} = Y^{(t-1)}$$

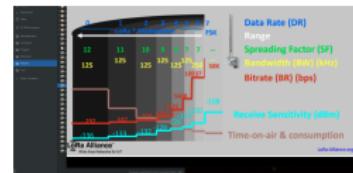

Figure 44: Vulnérabilité sociale.

 3. Expérimentation
 - 4. Exploitation des résultats**

Résultats

Comparaison

Valeurs initiales:

- générées aléatoirement (distribution normale)
- représentent les vulnérabilités individuelles.
- couleur foncée = vulnérabilité élevé

(a) Vulnérabilité individuelle.

(b) Vulnérabilité Sociale.

Valeurs finales:

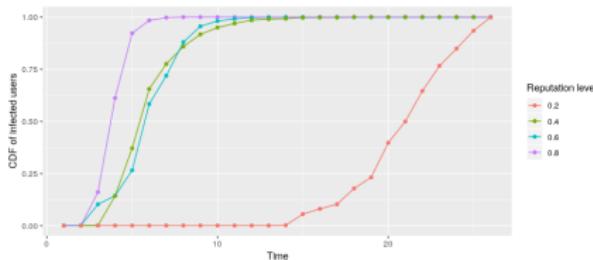

- obtenu après convergence.
- représentent les vulnérabilités sociales.

Figure 47: Vulnérabilité individuelle & sociale.

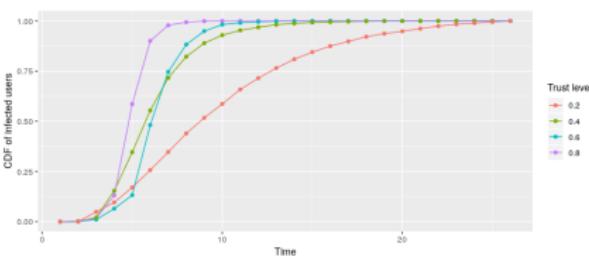

User ID	Vul individuel	Vul sociale
34	0.84	0.67
67	0.12	0.87
206	0.76	0.33
588	0.23	0.78

Table 32: Différence entre les vulnérabilités individuelles et sociales en matière de protection de la vie privée.

Exploitation des résultats

(a) Les données de Enron.

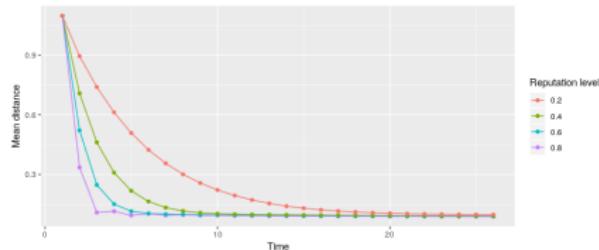

(b) Les données de Caliopen.

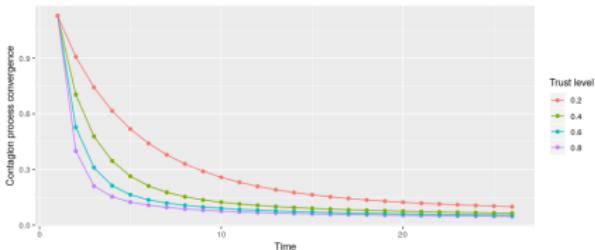

Figure 48: Fonction de distribution cumulative des utilisateurs infectés.

- ▶ Les utilisateurs avec des valeurs de réputation élevées contribuent considérablement à la diffusion
- ▶ Ils diffusent leur vulnérabilités rapidement et largement dans la messagerie.

Exploitation des résultats

(a) Les données de Enron.

(b) Les données de Caliopen.

Figure 49: Convergence du processus de diffusion.

- Attribuer une confiance à des utilisateurs vulnérables leur permet d'obtenir un niveau de réputation élevé.
- Par conséquent, infecter l'ensemble des valeurs de vulnérabilité de la messagerie.
